C3 X

Jack Maguire

Question 1

a

$$y = \frac{x^2 - 6x + 12}{4x - 11}$$

$$v = 4x - 11$$
$$v' = 4$$

$$u = x^2 - 6x + 12$$
$$u' = 2x - 6$$

$$\begin{aligned}
\frac{\Delta y}{\Delta x} &= \frac{vu' - v'u}{v^2} \\
&= \frac{(4x-11)(2x-6) - 4(x^2 - 6x + 12)}{(4x-11)^2} \\
&= \frac{8x^2 - 46x + 66 - 4x^2 + 24x - 48}{(4x-11)^2} \\
&= \frac{4x^2 - 22x + 18}{(4x-11)^2} \\
&= \frac{4x^2 - 22x + 18}{16x^2 - 88x + 121}
\end{aligned}$$

b

y is decreasing $\therefore \frac{\Delta y}{\Delta x} < 0$

$$\frac{4x^2 - 22x + 18}{16x^2 - 88x + 121} < 0$$

Since $16x^2 - 88x + 121$ only has one repeated root, and is a positive curve, it will never go below zero, so we can ignore solutions from it.

$$\begin{aligned}
\frac{4x^2 - 22x + 18}{16x^2 - 88x + 121} &< 0 \\
4x^2 - 22x + 18 &< 0 \\
(2x-1)(4x-9) &< 0 \\
1 < x &< 4.5
\end{aligned}$$

Question 2

$$\sin 2\theta = \cot \theta$$
$$2\sin\theta\cos\theta = \frac{\cos\theta}{\sin\theta}$$
$$2\sin^2\theta\cos\theta = \cos\theta$$
$$2\sin^2\theta\cos\theta - \cos\theta = 0$$
$$(\cos\theta)\left(2\sin^2\theta - 1\right) = 0$$

$$\cos\theta = 0$$
$$\theta = 90^\circ$$

$$2\sin^2\theta - 1 = 0$$
$$\sin^2\theta = \frac{1}{2}$$
$$\sin\theta = \pm\frac{\sqrt{2}}{2}$$
$$\theta = 45^\circ, 135^\circ$$

$$\theta = 45^\circ, 90^\circ, 135^\circ$$

Question 3

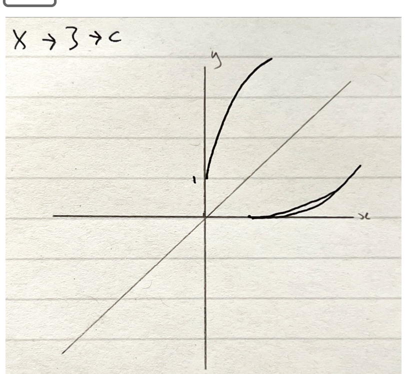
a

$$= f\left(1+\sqrt{9}\right)$$
$$= f(4)$$
$$= 1+\sqrt{4}$$
$$= 3$$

b

$$y = 1+\sqrt{x}$$
$$x = 1+\sqrt{y}$$
$$x - 1 = \sqrt{y}$$
$$(x-1)^2 = y$$
$$f(x) = (x-1)^2$$

c



d

$$
\begin{aligned}
1+\sqrt{x} &= (x-1)^2 \\
\sqrt{x} &= x^2-2x \\
x &= \left(x^2-2x\right)^2 \\
0 &= x^4-4x^3+4x^2-x
\end{aligned}
$$

We could say that $x = 0$, but we can see it is invalid on the graph and ignore it.

$$
\begin{aligned}
f(x) &= x^3-4x^2+4x-1 \\
f(1) &= 1-4+4-1=0 \\
0 &= (x-1)(x^2+bx+1) \\
0 &= \ldots - x^2+bx^2+\ldots \\
-1+b &= -4 \\
b &= -3 \\
f(x) &= (x-1)(x^2-3x+1)
\end{aligned}
$$

We could say that $x = 1$, but we can see it is invalid on the graph and ignore it.

$$
\begin{aligned}
0 &= x^2-3x+1 \\
x &= \frac{-b \pm \sqrt{b^2-4ac}}{2a} \\
&= \frac{3 \pm \sqrt{9-4}}{2}
\end{aligned}
$$

We could say that $x = \frac{3-\sqrt{5}}{2}$, but we can see it is invalid on the graph and ignore it.

$$
x = \frac{3+\sqrt{5}}{2}
$$

Question 4

a

$$
\begin{aligned}
\frac{\Delta y}{\Delta x} &= \frac{3y^2-4}{y^3-4y} \\
\frac{\Delta y}{\Delta x} &= \frac{y^3-4y}{3y^2-4} \\
2 &= \frac{3y^2-4}{y^3-4y} \\
1 &= \frac{3y^2-4}{2y^3-8y} \\
2y^3-8y &= 3y^2-4y
\end{aligned}
$$

$$
= \frac{3y^2-4}{2y^2-8}
$$

???

b

???

Question 5

$$
\begin{aligned}
\frac{\Delta y}{\Delta x} &= (-1)\left(4e^{2-x}\right) - (-2)\left(e^{4-2x}\right) \\
&= -4e^{2-x} + 2e^{4-2x} \\
0 &= -4e^{2-x} + 2e^{4-2x} \\
2e^{2-x} &= e^{4-2x} \\
2e^{2-x} &= \left(e^{4-2x}\right)^2
\end{aligned}
$$

$$
\begin{aligned}
\text{Let } y &= e^{2-x} \\
2y &= y^2 \\
0 &= y^2 - 2y \\
y &= 0, 2 \\
\ln 0 &\not\equiv \mathbb{R} \\
e^{2-x} &= 2 \\
x &= 2 - \ln 2 \\
&= 1.307
\end{aligned}
$$

$$
\begin{aligned}
y &= 4e^{2-x} - e^{4-2x} \\
&= 4
\end{aligned}
$$

$$
\begin{aligned}
\frac{\Delta y}{\Delta x}_{1.25} &= 0.49 \\
\frac{\Delta y}{\Delta x}_{1.307} &= 0 \\
\frac{\Delta y}{\Delta x}_{1.35} &= -0.32
\end{aligned}
$$

- Stationary Point = $(1.307, 4)$
- Kind = Maximum

Question 6

a

???

b

$$R\cos(\theta-\alpha) = R\cos\theta\cos\alpha + R\sin\theta\sin\alpha$$

$$\begin{aligned} R\sin\alpha &= 2 \\ R\cos\alpha &= 5 \\ \tan\alpha &= \frac{2}{5} \\ \alpha &= 21.8 \end{aligned}$$

$$\begin{aligned} R^2 &= 5^2 + 2^2 \\ R &= \sqrt{25+4} \\ R &= \sqrt{29} \end{aligned}$$

$$5\cos\theta + 2\sin\theta \equiv \sqrt{29}\cos(\theta - 21.8°)$$

c

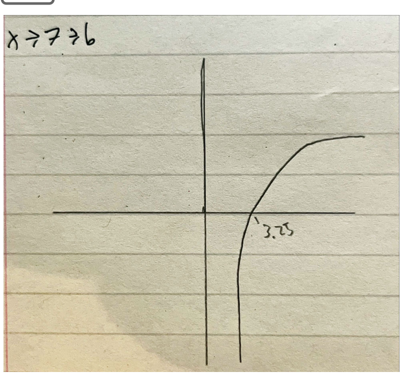
???

Question 7

a

1. Take the natural logarithm of x value.
2. Shift the graph right by 12 units.
3. Shrink the graph horizontally by a factor of 4.

b



Question 8

a

$$v = x \qquad u = \sqrt{x+1}$$

$$v' = 1 \qquad u' = \frac{1}{2}(x+1)^{-\frac{1}{2}}$$

$$\begin{aligned}\frac{\Delta y}{\Delta x} &= vu' + v'u \\ &= x\frac{1}{2}(x+1)^{-\frac{1}{2}} + (x+1)^{\frac{1}{2}} \\ &= (x+1)^{-\frac{1}{2}}\left(x\frac{1}{2} + (x+1)\right) \\ &= (x+1)^{-\frac{1}{2}}\left(\frac{3}{2}x + 1\right) \\ &= \frac{1}{2}(3x+2)(x+1)^{-\frac{1}{2}}\end{aligned}$$

b

$$v = x\sqrt{x+1} \qquad u = \sin 2x$$

$$v' = \frac{1}{2}(3x+2)(x+1)^{-\frac{1}{2}} \qquad u' = 2\cos 2x$$

$$\begin{aligned}\frac{\Delta y}{\Delta x} &= vu' + v'u \\ &= \left(x\sqrt{x+1}\right)(2\cos 2x) + \left(\frac{1}{2}(3x+2)(x+1)^{-\frac{1}{2}}\right)(\sin 2x) \\ &= \left(\frac{\pi}{2}\sqrt{\frac{\pi}{2}+1}\right)(2\cos \pi) + \left(\frac{1}{2}(3\frac{\pi}{2}+2)(\frac{\pi}{2}+1)^{-\frac{1}{2}}\right)(\sin \pi) \\ &= -2\left(\frac{\pi}{2}\sqrt{\frac{\pi}{2}+1}\right) \\ &= -\pi\sqrt{\frac{\pi}{2}+1}\end{aligned}$$
