C3 X

Jack Maguire

Question 1

a

$$y = \frac{x^2 - 6x + 12}{4x - 11}$$

$$v = 4x - 11$$
$$v' = 4$$

$$u = x^2 - 6x + 12$$

$$u' = 2x - 6$$

$$\frac{\Delta y}{\Delta x} = \frac{vu' - v'u}{v^2}$$

$$= \frac{(4x - 11)(2x - 6) - 4(x^2 - 6x + 12)}{(4x - 11)^2}$$

$$= \frac{8x^2 - 46x + 66 - 4x^2 + 24x - 48}{(4x - 11)^2}$$

$$= \frac{4x^2 - 22x + 18}{(4x - 11)^2}$$

$$= \frac{4x^2 - 22x + 18}{16x^2 - 88x + 121}$$

b

y is decreasing $\therefore \frac{\Delta y}{\Delta x} < 0$

$$\frac{4x^2 - 22x + 18}{16x^2 - 88x + 121} < 0$$

Since $16x^2 - 88x + 121$ only has one repeated root, and is a positive curve, it will never go below zero, so we can ignore solutions from it.

$$\frac{4x^2 - 22x + 18}{16x^2 - 88x + 121} < 0$$
$$4x^2 - 22x + 18 < 0$$
$$(2x - 1)(4x - 9) < 0$$
$$1 < x < 4.5$$

Question 2

$$\sin 2\theta = \cot \theta$$
$$2\sin \theta \cos \theta = \frac{\cos \theta}{\sin \theta}$$
$$2\sin^2 \theta \cos \theta = \cos \theta$$
$$2\sin^2 \theta \cos \theta - \cos \theta = 0$$

$$2\sin^2\theta\cos\theta - \cos\theta = 0$$
$$(\cos\theta)(2\sin^2\theta - 1) = 0$$

$$\cos \theta = 0$$
$$\theta = 90^{\circ}$$

$$2\sin^2 \theta - 1 = 0$$
$$\sin^2 \theta = \frac{1}{2}$$
$$\sin \theta = \pm \frac{\sqrt{2}}{2}$$
$$\theta = 45^\circ, 135^\circ$$

$$\theta = 45^{\circ}, 90^{\circ}, 135^{\circ}$$

Question 3

a

$$= f\left(1 + \sqrt{9}\right)$$

$$= f(4)$$

$$= 1 + \sqrt{4}$$

$$= 3$$

b

$$y = 1 + \sqrt{x}$$

$$x = 1 + \sqrt{y}$$

$$x - 1 = \sqrt{y}$$

$$(x - 1)^2 = y$$

$$f(x) = (x - 1)^2$$

 d

$$1 + \sqrt{x} = (x - 1)^2$$

$$\sqrt{x} = x^2 - 2x$$

$$x = (x^2 - 2x)^2$$

$$0 = x^4 - 4x^3 + 4x^2 - x$$

We could say that x = 0, but we can see it is invalid on the graph and ignore it.

$$f(x) = x^{3} - 4x^{2} + 4x - 1$$

$$f(1) = 1 - 4 + 4 - 1 = 0$$

$$0 = (x - 1)(x^{2} + bx + 1)$$

$$0 = \dots - x^{2} + bx^{2} + \dots$$

$$-1 + b = -4$$

$$b = -3$$

$$f(x) = (x - 1)(x^{2} - 3x + 1)$$

We could say that x = 1, but we can see it is invalid on the graph and ignore it.

$$0 = x^2 - 3x + 1$$
$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$
$$= \frac{3 \pm \sqrt{9 - 4}}{2}$$

We could say that $x = \frac{3-\sqrt{5}}{2}$, but we can see it is invalid on the graph and ignore it.

$$x = \frac{3 + \sqrt{5}}{2}$$

Question 4 $\frac{\Delta y}{\Delta x} = \frac{3y^2 - 4}{y^3 - 4y}$ $\frac{\Delta y}{\Delta x} = \frac{y^3 - 4y}{3y^2 - 4}$ $2 = \frac{3y^2 - 4}{y^3 - 4y}$ $2 = \frac{3y^2 - 4}{2y^3 - 8y}$ $2y^3 - 8y = 3y_{3-4}^2$ $2y^3 - 8y = 3y_{3-4}^2$ $y = \frac{3y^2 - 4}{2y^2 - 8}$????

$$y_{n+1} = \frac{6y_{+}^{2} - 8}{y_{+}^{2} - 9}$$

$$y_{1} = \frac{13}{2}$$

$$y_{2} = 6.918...$$

$$y_{3} = 6.430...$$

$$y_{5} = 6.430...$$

Question 5

$$\frac{\Delta y}{\Delta x} = (-1) \left(4e^{2-x} \right) - (-2) \left(e^{4-2x} \right)$$

$$= -4e^{2-x} + 2e^{4-2x}$$

$$0 = -4e^{2-x} + 2e^{4-2x}$$

$$2e^{2-x} = e^{4-2x}$$

$$2e^{2-x} = \left(e^{4-2x} \right)^2$$

Let
$$y = e^{2-x}$$

$$2y = y^2$$

$$0 = y^2 - 2y$$

$$y = 0, 2$$

$$\mathbb{R} \nsubseteq \ln 0$$

$$e^{2-x} = 2$$

$$x = 2 - \ln 2$$

$$= 1.307$$

$$y = 4e^{2-x} - e^{4-2x}$$

= 4

5

$$\frac{\Delta y}{\Delta x_{1.25}} = 0.49$$

$$\frac{\Delta y}{\Delta x_{1.307}} = 0$$

$$\frac{\Delta y}{\Delta x_{1.35}} = -0.32$$

as2-62

- Stationary Point = (1.307, 4)
- Kind = Maximum 🔥 🥕 < 0

Question 6

???

$$\frac{6}{C}$$

$$\frac{5}{5} = \frac{6}{2!8} = \frac{5}{5}$$

$$\frac{6}{6} = \frac{5}{5}$$

$$\frac{6}{6} = \frac{5}{5}$$

$$\frac{6}{6} = \frac{5}{5}$$

$$\frac{6}{5} = \frac{5}{5}$$

$$\frac{6}{5} = \frac{5}{5}$$

$$\frac{6}{5} = \frac{5}{5}$$

$$\frac{6}{5} = \frac{5}{5}$$

$$\frac{6}{6} = \frac{2!8}{5} = \frac{3}{5}$$

$$\frac{6}{6} = \frac{2!8}{5} = \frac{3}{5}$$

$$\frac{6}{6} = \frac{43.6 \pm 360}{500}$$

b

 $R\cos(\theta - \alpha) \equiv R\cos\theta\cos\alpha + R\sin\theta\sin\alpha$

$$R\sin\alpha = 2$$

$$R\cos\alpha = 5$$

$$\tan\alpha=\frac{2}{5}$$

$$\alpha = 21.8^{\circ}$$

$$R^2 = 5^2 + 2^2$$

$$R = \sqrt{25 + 4}$$

$$R = \sqrt{29}$$

$$5\cos\theta + 2\sin\theta \equiv \sqrt{29}\cos(\theta - 21.8^{\circ})$$

C ???

Question 7

(a)

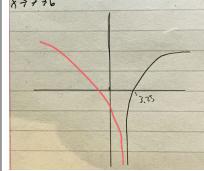

1. Take the natural logarithm of x value. $\frac{1}{2}$

3. Shrink the graph horizontally by a factor of 4. 🗸

b

show steps. also, reflect is y afy

Question 8

a

$$v = x$$
 $u = \sqrt{x+1}$ $v' = 1$ $u' = \frac{1}{2}(x+1)^{-\frac{1}{2}}$

$$\frac{\Delta y}{\Delta x} = vu' + v'u$$

$$= x\frac{1}{2}(x+1)^{-\frac{1}{2}} + (x+1)^{\frac{1}{2}}$$

$$= (x+1)^{-\frac{1}{2}} \left(x\frac{1}{2} + (x+1)\right)$$

$$= (x+1)^{-\frac{1}{2}} \left(\frac{3}{2}x + 1\right)$$

$$= \frac{1}{2}(3x+2)(x+1)^{-\frac{1}{2}}$$

b

$$v = x\sqrt{x+1}$$

$$v' = \frac{1}{2}(3x+2)(x+1)^{-\frac{1}{2}}$$

$$u = \sin 2x$$

$$u' = 2\cos 2x$$

$$\frac{\Delta y}{\Delta x} = vu' + v'u$$

$$= \left(x\sqrt{x+1}\right)(2\cos 2x) + \left(\frac{1}{2}(3x+2)(x+1)^{-\frac{1}{2}}\right)(\sin 2x)$$

$$= \left(\frac{\pi}{2}\sqrt{\frac{\pi}{2}+1}\right)(2\cos \pi) + \left(\frac{1}{2}(3\frac{\pi}{2}+2)(\frac{\pi}{2}+1)^{-\frac{1}{2}}\right)(\sin \pi)$$

$$= -2\left(\frac{\pi}{2}\sqrt{\frac{\pi}{2}+1}\right)$$

$$= -\pi\sqrt{\frac{\pi}{2}+1}$$
