C3 X

Jack Maguire

Question 1

a

$$y = \frac{x^2 - 6x + 12}{4x - 11}$$

$$v = 4x - 11$$
$$v = 4$$

$$u = x^2 - 6x + 12$$

$$u\prime = 2x - 6$$

$$\frac{\Delta y}{\Delta x} = \frac{vuv - vvu}{v^2}$$

$$= \frac{(4x - 11)(2x - 6) - 4(x^2 - 6x + 12)}{(4x - 11)^2}$$

$$= \frac{8x^2 - 46x + 66 - 4x^2 + 24x - 48}{(4x - 11)^2}$$

$$= \frac{4x^2 - 22x + 18}{(4x - 11)^2}$$

$$= \frac{4x^2 - 22x + 18}{16x^2 - 88x + 121}$$

♦ b

y is decreasing $\therefore \frac{\Delta y}{\Delta x} < 0$

$$\frac{4x^2 - 22x + 18}{16x^2 - 88x + 121} < 0$$

Since $16x^2 - 88x + 121$ only has one repeated root, and is a positive curve, it will never go below zero, so we can ignore solutions from it.

$$\frac{4x^2 - 22x + 18}{16x^2 - 88x + 121} < 0$$
$$4x^2 - 22x + 18 < 0$$
$$(2x - 1)(4x - 9) < 0$$
$$1 < x < 4.5$$

Question 2

$$\sin 2\theta = \cot \theta$$
$$2\sin \theta \cos \theta = \frac{\cos \theta}{\sin \theta}$$
$$2\sin^2 \theta \cos \theta = \cos \theta$$
$$2\sin^2 \theta \cos \theta - \cos \theta = 0$$
$$(\cos \theta) (2\sin^2 \theta - 1) = 0$$

$$\cos\theta = 0$$
$$\theta = 90^{\circ}$$

$$2\sin^{2}\theta - 1 = 0$$

$$\sin^{2}\theta = \frac{1}{2}$$

$$\sin\theta = \pm \frac{\sqrt{2}}{2}$$

$$\theta = 45^{\circ}, 135^{\circ}$$

$$\theta = 45^{\circ}, 90^{\circ}, 135^{\circ}$$

Question 3

a

$$= f \left(1 + \sqrt{9} \right)$$
$$= f (4)$$
$$= 1 + \sqrt{4}$$
$$= 3$$

b

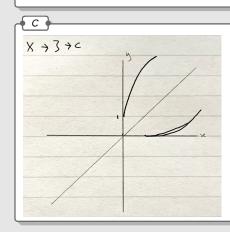

$$y = 1 + \sqrt{x}$$

$$x = 1 + \sqrt{y}$$

$$x - 1 = \sqrt{y}$$

$$(x - 1)^{2} = y$$

$$f(x) = (x - 1)^{2}$$

• d

$$1 + \sqrt{x} = (x - 1)^{2}$$

$$\sqrt{x} = x^{2} - 2x$$

$$x = (x^{2} - 2x)^{2}$$

$$0 = x^{4} - 4x^{3} + 4x^{2} - x$$

We could say that x = 0, but we can see it is invalid on the graph and ignore it.

$$f(x) = x^3 - 4x^2 + 4x - 1$$

$$f(1) = 1 - 4 + 4 - 1 = 0$$

$$0 = (x - 1)(x^2 + bx + 1)$$

$$0 = \dots - x^2 + bx^2 + \dots$$

$$-1 + b = -4$$

$$b = -3$$

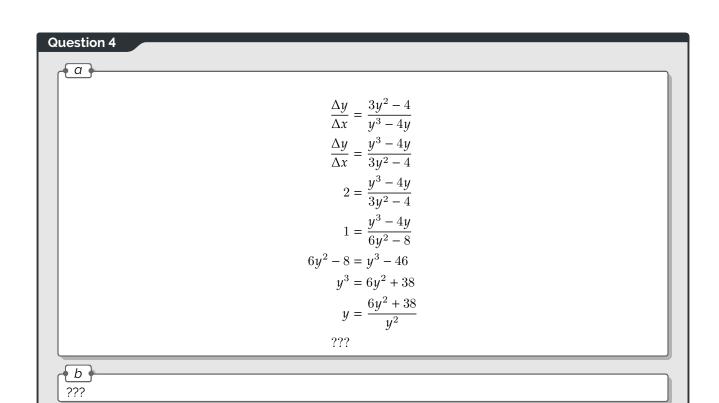

$$f(x) = (x - 1)(x^2 - 3x + 1)$$

We could say that x = 1, but we can see it is invalid on the graph and ignore it.

$$0 = x^2 - 3x + 1$$
$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$
$$= \frac{3 \pm \sqrt{9 - 4}}{2}$$

We could say that $x = \frac{3-\sqrt{5}}{2}$, but we can see it is invalid on the graph and ignore it.

$$x = \frac{3 + \sqrt{5}}{2}$$

Question 5

$$\frac{\Delta y}{\Delta x} = (-1) (4e^{2-x}) - (-2) (e^{4-2x})$$

$$= -4e^{2-x} + 2e^{4-2x}$$

$$0 = -4e^{2-x} + 2e^{4-2x}$$

$$2e^{2-x} = e^{4-2x}$$

$$2e^{2-x} = (e^{4-2x})^2$$

Let
$$y = e^{2-x}$$

$$2y = y^2$$

$$0 = y^2 - 2y$$

$$y = 0, 2$$

$$\ln 0 \neq \mathbb{R}$$

$$e^{2-x} = 2$$

$$x = 2 - \ln 2$$

$$= 1.307$$

$$y = 4e^{2-x} - e^{4-2x}$$

$$\frac{\Delta y}{\Delta x}_{1.25} = 0.49$$

$$\frac{\Delta y}{\Delta x}_{1.307} = 0$$

$$\frac{\Delta y}{\Delta x}_{1.305} = -0.32$$

=4

- Stationary Point = (1.307, 4)
- Kind = Maximum

Question 6

???

b

$$R\cos(\theta - \alpha) = R\cos\theta\cos\alpha + R\sin\theta\sin\alpha$$

$$R\sin\alpha = 2$$

$$R\cos\alpha=5$$

$$\tan\alpha = \frac{2}{5}$$

$$\alpha = 21.8$$

$$R^2 = 5^2 + 2^2$$

$$R = \sqrt{25 + 4}$$

$$R = \sqrt{29}$$

$$5\cos\theta + 2\sin\theta \equiv \sqrt{29}\cos(\theta - 21.8^{\circ})$$

???

Question 7

a

- 1. Take the natural logarithm of x value.
- 2. Shift the graph right by 12 units.
- 3. Shrink the graph horizontally by a factor of 4.
